ranjancom2000@gmail.com

Recommended Hosting

GitHub Pages with custom domain

Backend

Google Sheets through Google Apps Script API

1. What Is Included

The FastStack White Label License allows a customer to deploy and rebrand the application for their own business, clients, internal finance teams, or agency offering.

Application Rights

- Use the FastStack expense tracker under your own brand.
- Customize company name, logo, colors, text, and domain.
- Deploy for your own internal team or customers.
- Use petty cash, project, tour, and multi-group budget workflows.

Feature Scope

- Secure login and user management.
- Cash in, cash out, projects, groups, balances, and reports.
- Google Sheets backend through a private API.
- Daily Google Drive backups and restore support.

The license does not include ownership of the FastStack brand name unless separately agreed. White-label buyers should replace the visible brand with their own company identity.

2. Required Services and Accounts

Service	Purpose	Required Access
GitHub	Host source files and GitHub Pages site.	Repository admin access.
GitHub Pages	Publish the frontend application.	Pages enabled from the target branch.
Google Sheets	Centralized database for users, projects, transactions, balances, settings, and backups list.	Spreadsheet owner access.
Google Apps Script	Secure backend API between the app and Google Sheets.	Script owner and web app deployment access.

Service	Purpose	Required Access
Google Drive	Store daily backup copies and restore files.	Folder owner access.
Domain Provider	Connect your custom domain to GitHub Pages.	DNS management access.
Email Account	Receive registration, support, and operational messages.	Admin mailbox access.

3. Deployment Options

Option A: Deploy on Your Own Domain

1. Create or select a GitHub repository for the white-label application.
2. Upload the frontend files: `index.html`, `app.js`, `styles.css`, `config.js`, and related assets.
3. Enable GitHub Pages from repository settings.
4. In your domain provider DNS settings, create a `CNAME` record pointing your subdomain to `your-github-username.github.io`.
5. Add the custom domain in GitHub Pages settings.
6. Enable HTTPS after GitHub verifies DNS.

Option B: Deploy with GitHub Pages URL

1. Create a GitHub repository, for example `expense-tracker`.
2. Commit the application files to the main branch.
3. Open repository Settings, then Pages.
4. Select the branch and root folder for deployment.
5. Save the Pages configuration.
6. Open the generated URL, usually `https://username.github.io/repository-name/`.

After deployment, update `config.js` with the production Google Apps Script Web App URL.

4. Google Sheets Backend Setup

1. Create a new Google Sheet for the application database.
2. Create tabs for users, sessions, projects, categories, cash-in records, cash-out records, transactions, settings, backups, and audit history.
3. Open Extensions, then Apps Script.
4. Paste the FastStack backend Apps Script code into `Code.gs`.
5. Set script properties for spreadsheet ID, backup folder ID, security keys, and allowed frontend origin.
6. Deploy the Apps Script project as a Web App.
7. Set "Execute as" to the script owner and access to the intended audience.

8. Copy the Web App URL and place it in frontend `config.js`.

Backend Security Checklist

- Do not expose the spreadsheet URL directly to application users.
- Use the Apps Script Web App as the only bridge between frontend and Google Sheets.
- Validate email, password, amount, date, category, and text fields server-side.
- Sanitize input against formula injection by escaping values beginning with `=`, `+`, `-`, or `@`.
- Use session tokens and reject expired or invalid sessions.
- Keep admin-only operations protected.

5. Automated Backup Setup

- 1. Create a dedicated Google Drive folder named after your white-label application.
- 2. Copy the folder ID from the Drive URL.
- 3. Add the folder ID to Apps Script properties.
- 4. Run the backend setup function once to create or verify required sheets and backup configuration.
- 5. Create a time-driven Apps Script trigger for daily backups.
- 6. Use a retention policy of 30 days, or adjust according to your business policy.
- 7. Test "Backup Now" from the app and confirm a backup file appears in Drive.
- 8. Test restore on a copy of the sheet before using restore in production.

Recommended schedule: daily at a low-traffic time such as 2:15 AM in the operating timezone.

6. Branding Customization

Item	Where to Update	Recommendation
Application name	<code>index.html</code> and visible headings	Use the customer's product or company name.
Logo	Header, login screen, favicon, social preview image	Use SVG or optimized PNG assets.
Colors	<code>styles.css</code> variables	Set primary, accent, surface, and status colors.
Domain	GitHub Pages custom domain and DNS	Use HTTPS and a branded subdomain.
Email	Support links and notification templates	Use a monitored support mailbox.
Reports	PDF report title, footer, and branding	Include company name and contact details.

7. User Management and Security

- Allow only authorized email domains if the deployment is internal.
- Require strong passwords and email verification for new accounts.
- Use role-based access for admin, manager, and standard users where needed.
- Review user accounts regularly and disable inactive accounts.
- Keep Apps Script deployments and script properties private.
- Do not commit secrets, tokens, spreadsheet IDs, or private URLs into public repositories unless they are intended to be public.
- Audit high-risk actions such as restore, delete, password changes, and admin changes.

8. Maintenance and Support

- Check GitHub Pages deployment status after every update.
- Review Apps Script execution logs for failed API calls.
- Monitor Google Drive storage and backup retention.
- Test login, registration, cash-in, cash-out, PDF export, and backup restore after major changes.
- Keep a copy of the last known good frontend and backend code.
- Contact ranjancom2000@gmail.com for setup help, customization, or deployment support.

9. Deployment Checklist

Task	Status
Brand name, logo, colors, and support email updated.	Pending
GitHub Pages deployment created and HTTPS enabled.	Pending
Custom domain DNS configured if required.	Pending
Google Sheet database created and protected.	Pending
Google Apps Script backend deployed as Web App.	Pending
<code>config.js</code> updated with backend API URL.	Pending

Task	Status
Daily backup trigger created and tested.	Pending
Registration, login, cash-in, cash-out, reports, and restore tested.	Pending
